2 Introduction

Intertek Testing Services NA Ltd. (Intertek) has conducted testing for Domtek Building Products to evaluate the surface burning characteristics of Trusscore PVC panels. Testing was conducted in accordance with the standard methods of ASTM E84-15b, *Standard Test Method for Surface Burning Characteristics of Materials*.

This evaluation began February 3, 2016 and was completed the same day.

3 Test Samples

3.1 SAMPLE SELECTION

Samples were submitted to Intertek directly from the client and were not independently selected for testing. The sample panels were received at the Evaluation Center on December 17, 2015.

SAMPLE AND ASSEMBLY DESCRIPTION

Upon receipt of the samples at the Intertek Coquitlam laboratory, they were placed in a conditioning room where they remained in an atmosphere of 23 ± 3°C (73.4 ± 5°F) and 50 ± 5% relative humidity.

The sample products were described as, ½ in. thick by 16 in. wide by 12 ft. long PVC panels. The panels were identified by the client as Trusscore PVC Panels.

For this trial run, 24 in. wide by 24 ft. of sample material was supported by ¼ in. steel rods spaced every 24 in. and 20 ga. 2 in x 2 in galvanized steel netting spanning the upper ledge of the flame spread tunnel. A layer of 6 mm reinforced cement board was placed over top of the samples, the tunnel lid was lowered into place, and the samples were then tested in accordance with ASTM E84-15b.
4 Testing and Evaluation Methods

4.1. TEST STANDARD

The results of the tests are expressed by indexes, which compare the characteristics of the sample under tests relative to that of select grade red oak flooring and inorganic-cement board.

(A) Flame Spread Index:

This index relates to the rate of progression of a flame along a sample in the 25 foot tunnel. A natural gas flame is applied to the front of the sample at the start of the test and drawn along the sample by a draft kept constant for the duration of the test. An observer notes the progression of the flame front relative to time.

The test apparatus is calibrated such that the flame front for red oak flooring passes out the end of the tunnel in five minutes, thirty seconds (plus or minus 15 seconds).

(B) Smoke Developed:

A photocell is used to measure the amount of light, which is obscured by the smoke passing down the tunnel duct. When the smoke from a burning sample obscures the light beam, the output from the photocell decreases. This decrease with time is recorded and compared to the results obtained for red oak, which is defined to be 100.
5 Testing and Evaluation Results

5.1. RESULTS AND OBSERVATIONS

(A) Flame Spread

The resultant flame spread indexes are as follows:
(Index rounded to nearest 5)

<table>
<thead>
<tr>
<th>Sample Material</th>
<th>Flame Spread</th>
<th>Flame Spread Index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trusscore PVC Panels</td>
<td>9</td>
<td>10</td>
</tr>
</tbody>
</table>

(B) Smoke Developed

The areas beneath the smoke developed curve and the related indexes are as follows:
(For smoke developed indexes 200 or more, index is rounded to the nearest 50. For smoke developed indexes less than 200, index is rounded to nearest 5)

<table>
<thead>

<th>Sample Material</th>
<th>Smoke Developed</th>
<th>Smoked Developed Index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trusscore PVC Panels</td>
<td>397</td>
<td>400</td>
</tr>
</tbody>
</table>

(C) Observations

During the test, the sample surface ignited at approximately 34 seconds, and the flame began to progress along the sample until it reached the maximum flame spread.
6 Conclusion

The ½ in. thick Truscore PVC Panels submitted by Domtek Building Products, exhibited the following flame spread characteristics when tested in accordance with ASTM E84-15b, Standard Test Method for Surface Burning Characteristics of Materials.
